

Get Azure Advisor

Copilot Studio configuration for authenticated live Azure tenant data only

Every finding must come from Azure Monitor Logs under the signed-in user's delegated access. Static files, websites, skills, web search, and documentation tools are excluded.

Target configuration

Area	Required value
Harness / Model	GitHub Copilot harness (cliagent-1.0.0) / Claude Sonnet 5
Authentication	Authenticate with Microsoft; always authenticate; group-membership access
Live tool	Azure Monitor Logs > Run query and list results V2 (QueryDataV2)
Tool identity	User authentication; never Maker authentication for tenant analysis
Knowledge / Skills	None / None
Other tools	None
Web search / Memory	Off / Off
Connected agents / Workflows	None / None
Moderation / Public website	Medium / Not enabled

Configure

- Replace Build > Instructions with **agent-recreation/agent-instructions.md**.
- Keep only **Azure Monitor Logs > Run query and list results V2** under Tools.
- Set authentication to **User**. Keep Query and Time Range Type AI-filled; Timerange remains dynamic.
- Remove Microsoft Learn Docs MCP and every other non-tenant tool.
- Remove every uploaded file, website knowledge source, and skill.
- Keep web search and memory off. Do not add connected agents or workflows.
- Test with real authorized identities, then publish only to approved authenticated channels.

Query context and evidence

Before querying, request confirmation of the tenant context, subscription or Log Analytics workspace scope, and time range.

- Identify Azure Monitor Logs as the source for every finding.
- State the confirmed scope and collection time.
- Ground conclusions in returned rows and redact unnecessary customer data.
- Keep denied, unavailable, unsupported, and empty results distinct.
- Do not interpret an empty result as zero spend, zero waste, or a healthy environment.

Stop condition

If live tenant evidence is unavailable, stop the assessment, explain the missing access, scope, or data, and do not provide inferred recommendations or best-practice filler.

Capability boundary

The only live data source is Azure Monitor Logs. The agent has no Azure Advisor API, Cost Management API, Resource Graph, Power BI, Function App, custom API, or tenant-wide Azure MCP connection. Its name does not establish an Azure Advisor integration.

Validation

- Exactly one tool exists: Azure Monitor Logs QueryDataV2 with User authentication.
- Skills, static knowledge, web search, memory, connected agents, and workflows are absent or off.
- The agent requests tenant, scope, and time range before querying.
- Every finding includes source, scope, and collection time.
- The agent refuses to assess or recommend without live tenant evidence.
- No credentials, connection IDs, tenant IDs, subscription IDs, generated findings, or sample costs are committed.
